

WHY DAMP AND MOLD ARE MORE THAN JUST AN EYESORE

Do you constantly wipe condensation from your windows?

Notice a persistent musty smell in your rooms, or see black mould creeping into corners?

These are clear signs that your home has a ventilation problem.

In the damp UK climate, trapped moisture doesn't just damage your property's structure and decor. It creates an unhealthy environment that can trigger allergies, asthma, and other respiratory issues, especially in children.

Many British homes, both old and new, are so well-sealed for warmth that they can't breathe. This trapped, humid air is the root cause of the problem.

THE CLIMTEC SOLUTION: HOW IT WORKS

A Climtec heat recovery unit is the intelligent, modern solution to poor ventilation. It acts like a mechanical lung for your home, solving the two biggest problems of traditional ventilation:

It Provides Fresh Air (Without the Draughts) Simply opening a window lets in cold air, street noise, and pollution. A Climtec unit provides a constant, gentle flow of air — it simultaneously breathes out damp, stale air while breathing in fresh, filtered air from outside.

It Saves Your Heat (And Your Money) Here's the clever part. As the warm, stale air you've already paid to heat is extracted, our highly efficient aluminium heat exchanger captures up to 93% of its heat. This heat is then used to warm up the fresh, incoming air for free.

The Result: You get a constant supply of fresh, clean, pre-warmed air without the cold draughts and energy waste of an open window. Powered by ultra-reliable German motors, our units eliminate the conditions for mould to grow, permanently solving the problem at its source.
